Supplemental Material

Humoral Immunity in Arsenic Exposed Children in Rural Bangladesh: Total Immunoglobulins and Vaccine-Specific Antibodies

Rubhana Raqib, Sultan Ahmed, Khalid Bin Ahsan, Maria Kippler, Evana Akhtar, Anjan Kumar Roy, Ying Lu, Shams El Arifeen, Yukiko Wagatsuma, and Marie Vahter

Table of Contents

Table S1: Descriptive statistics of exposures and outcomes by different supplementation groups.

Table S2: Descriptive statistics of measles, mumps and rubella vaccine-specific plasma IgG in children at 9 years of age.

Table S3: Regression analysis of associations of arsenic exposure (log₂-transformed U-As) with measles and rubella-specific post-immunization plasma IgG (log₂-transformed) in the lowest quartile of measles and rubella-specific pre-immunization IgG concentrations.

Figure SI: Flow chart describing the enrolment of mother-child pairs in the current study, including exposure and outcome measures.

Figure S2: Illustration of the fold change in measles-specific plasma IgG (post-immunization IgG/pre-immunization IgG) at different pre-immunization measles-specific plasma IgG titers in children at 9 years of age.

Figure S3: Illustration of the fold change in mumps-specific plasma IgG (post-immunization IgG/pre-immunization IgG) at different pre-immunization mumps-specific plasma IgG titers in children at 9 years of age.

Figure S4: Illustration of the fold change in rubella-specific plasma IgG (post-immunization IgG/pre-immunization IgG) at different pre-immunization rubella-specific plasma IgG titers in children at 9 years of age.
